DETAILED PROJECT REPORT

Delper Smart City & Digital Ecosystem Programme

Staged corporate development plan — pre-seed through concurrent global capital raise

This report follows the actual sequence of corporate development, in the order capital is raised and deployed — not a generic template order. Each stage states its capital requirement, purpose, KPIs, and the financial ratios relevant at that stage. Figures marked with a caution note reflect findings from independent reconciliation work; figures without a note are drawn directly from Delper's v10.3 financial model.

STAGE 1 — Pre-Seed Capital

$5.0M — Company Formation & Concept Validation - ROI

Funds company incorporation, founding team costs, legal and advisory fees, initial platform architecture, and concept validation ahead of seed-stage fundraising. This stage precedes any revenue generation. USD 5 Million will be received in the www.ahanainvestments.com Citi Bank, Singapore, Account.

$5.0M	18-24 mo	$208-278K	$0
Capital Raised	Runway	Monthly Burn	Revenue (Pre-Revenue)

Milestones to seed: founding team assembled, corporate structure designed, initial technical architecture documented, seed-stage investor pipeline established.

STAGE 2 — Seed Capital

$66.5M — Team Scale-Up & Market Entry Preparation - Profile

Raised in conjunction with procurement of a second $125M SBLC facility (per the Investor Pitch Deck, Months 4-10). Funds team scaling, MVP development, and initial market entry — including a planned 1,000,000-user onboarding pipeline in India.

$66.5M	$71.5M	1.0M	6 mo
Seed Capital	Cumulative to Date	Target Users (India)	Onboarding Window

Note: this seed round is tied to SBLC procurement — a bank instrument, not cash equity. Availability and timing of the second SBLC should be confirmed as a condition of this stage.

STAGE 3 — Corporate Structure

Singapore Holding Company Incorporation

Delper GCCP Holdings Pte Ltd incorporated in Singapore as the ultimate holding entity, 98% owned by Ahana Derivatives and Investments FZCO (Dubai), which is 100% owned by GK Bharta. The remaining 2% is held by an unspecified party, not yet identified. With smart city construction financed solely through the PAT-linked MTN mechanism (Stage 9) rather than an IPO/FPO equity raise, there is no further capital dilution beyond this fixed 2% stake.

SG	Dubai	98%	60
Jurisdiction (Delper GCCP Holdings)	Jurisdiction (Ahana Derivatives FZCO)	Founder Equity (2% Unspecified Holder)	Planned Country SPVs

Ownership chain: GK Bharta -> Ahana Derivatives and Investments FZCO (Dubai, 100%) -> Delper GCCP Holdings Pte Ltd (Singapore, 98%) -> all smart cities and platform assets. The 2% minority stake in Delper GCCP Holdings requires a named counterparty (partner, management incentive pool, or co-investor) before this structure is complete for due diligence purposes. Governance: single holding company with country-level SPV subsidiaries for each smart city jurisdiction, ring-fencing project-level debt from corporate-level obligations.

To Whom So Ever It May Concern

STAGE 4 — Independent Verification

Appointment of PwC — Full Drop-Down Due Diligence on Delper v10.3

A Big Four independent audit firm is appointed to conduct comprehensive due diligence on the entire v10.3 financial model prior to any institutional capital raise — the step this programme's internal reconciliation work (extensive, but self-prepared) cannot substitute for.

$8-15M	**4-6 mo**	**21**
Estimated Cost	Estimated Duration	Statements Under Review

Known items PwC's scope should specifically address: (1) digital ad income ($10.62T/yr terminal) requires unprecedented global market share — independent verification needed before use in any credit application; (2) supply chain income implies capturing 13.2% of world GDP versus Visa's 0.033% after 65 years; (3) zero of 60 target sovereign guarantees are executed; (4) the 13% smart city rental yield exceeds real-world commercial real estate benchmarks (4-8% prime, 8-12% higher-risk); (5) City Timeline names only 456 of 2,200 planned cities.

STAGE 5 — Technology Infrastructure

AWS Cloud Infrastructure Build-Out

Cloud infrastructure supporting the digital platform (ad serving, user wallets, KYC verification) and, at later stages, smart city IoT and building management systems.

Multi-AZ	**99.95%**	**6B**	**Y1+**
Architecture	Target Uptime SLA	Target Capacity (Terminal)	Scales With Onboarding

Infrastructure scales with actual user growth (Stage 6) rather than being provisioned upfront for terminal-scale capacity, reducing pre-revenue fixed cost.

STAGE 6 — Revenue Launch — Digital

Digital Advertising & Survey Platform Launch

Platform launch generating ad and survey revenue, funding user DPR wallet credits. Growth trajectory anchored to real-world platform scale-up precedent (ByteDance/TikTok-pace early growth, tapering to sustainable rates) rather than the flat terminal figure used in v10.3's headline model.

$5.0B	**$69.0B**	**$2.64T**	**150%->10%**
Year 1 Revenue	Year 4 Revenue	Year 11 Ceiling (Realistic)	CAGR Taper Y1-20

The v10.3 model's flat $10.62T/yr terminal figure requires capturing 14.4x the entire current global digital ad industry — not achievable at any point on a realistic growth curve. Use the $2.64T realistic ceiling (Year 11) for financing calculations; treat $10.62T as aspirational and unverified.

STAGE 7 — Revenue Launch — Supply Chain

Supply Chain Facilitation Platform Launch

Facilitation and profit-share revenue on ecosystem trade flow, launched alongside the digital platform.

$32T	**$3.20T**	**$13.86T**	**13.2%**
Total Global Retail (Addressable)	Realistic Ceiling (10%)	v10.3 Terminal (Unverified)	Implied % of World GDP

$13.86T/yr implies capturing 13.2% of all global economic output — 396x Visa's entire revenue, despite Visa processing the majority of global card transactions after 65 years. A realistic ceiling (Amazon-style 8-10% of GMV applied to global retail) is approximately $3.20T/yr at full market maturity.

To Whom So Ever It May Concern

STAGE 8 — Technology Infrastructure

Quantum Computing Installation

Quantum computing capacity installed to support platform security (IAH — Identity Authentication Hub), fraud detection, and optimization across the digital and supply chain platforms.

$883M	IAH	100%
Annual Cost	Primary Use Case	KYC-Verified Coverage (Target)

STAGE 9 — Capital Raising

Concurrent Capital Raise — 195-Country Pilot & 4,400-City Full Programme

Per the established Phase 1/Phase 2 concurrency: the 195-country pilot (one right-sized city per country, sized to each government's realistic guarantee capacity) and the full 4,400-city programme (2,200 smart cities + 2,200 retrofit cities) are raised and executed side by side, not sequentially — Phase 1 does not delay Phase 2's timeline, and Phase 2 is not contingent on Phase 1 completing first.

Primary Mechanism: Monthly PAT-Linked MTN Programme

Rather than a single upfront MTN sized to projected terminal revenue, MTN tranches are issued monthly, sized to that month's actual, independently audited PAT (Profit After Tax) — not projected future profit. This is self-correcting by construction: a tranche can never exceed profit that has already, verifiably occurred. If revenue tracks the realistic trajectories in Stages 6-7 rather than the flagged aspirational figures, tranche sizes shrink proportionally and automatically, with no separate correction required.

$10.0B	$4.10T	PwC	N/A
Year 1 Monthly Tranche (Verified PAT)	Year 21 Monthly Tranche (Verified PAT)	Required Audit Before Each Tranche	Not Usable Pre-Revenue (Stages 1-5)

Requirements for this mechanism to be genuine: (1) PAT independently audited before each tranche is issued — Stage 4's PwC engagement becomes load-bearing here, not a one-time gate; (2) a real arranger bank places each tranche with real investors, structured similarly to royalty or revenue-based financing (an established category in pharma and media financing); (3) investors are buying a claim on demonstrated, already-realized profit, not a projection.

Build-Out Timeline Under the PAT-Linked Mechanism

Modeled year by year: each year's available capital equals that year's verified PAT (from digital, employment, and supply chain revenue) plus NOI from already-completed cities' 13% rental yield, less debt service on all outstanding MTNs (each amortizing over its own 15-year term). The remainder funds that year's new construction, which becomes next year's revenue base — a genuine compounding cycle bounded at every step by real, already-earned profit.

~100	~1,000	2,200	Year 26
Cities Completed by Year 11	Cities Completed by Year 20-21	Full Programme Complete	Completion Year

Growth is deliberately slow in the earliest years — Year 1 PAT ($0.12T) cannot fund even one full city ($306.25B) — and accelerates only once enough completed cities generate real rental NOI on top of the original digital/employment profit base. This is the mechanism working as intended: it cannot outpace real, verified earnings at any point, in exchange for a 26-year timeline that is fully traceable to figures already verified elsewhere in this report, rather than to the flagged aspirational revenue figures.

Certificate For Requirement of Funds and Project Viability

To Whom So Ever It May Concern

Asset Value vs. Income Value (4,400 Cities)

Terminal EV ($1,253.94T) is an income-based valuation (15x annual net profit) -- comparable to a company's market capitalisation. This is a genuinely different figure from the Asset Value of the 4,400 cities ($673.75T smart city + $674.30T retrofit = $1,348.05T total), which is construction/book cost -- comparable to replacement cost. Both are legitimate; they answer different questions and must never be added together, as doing so would double-count the same underlying cities under two different valuation methods.

$1,253.94T	$1,348.05T	0.93x
Terminal EV (Income Basis, 15x Profit)	Asset Value (Construction Cost Basis)	EV / Asset Ratio

Note that Asset Value exceeds Terminal EV (a 0.93x ratio) -- meaning the projected income stream, even using this programme's own figures, does not fully justify the construction cost on a pure return-on-cost basis. This is a legitimate finding worth surfacing directly rather than reconciling away.

STAGE — — Ecosystem Utility

DPR Token — Medium of Exchange & Tokenomics

The DPR Token is the sole medium of exchange for all transactions within the Delper ecosystem (digital, supply chain, and city construction). GK Bharta owns 100% of all DPR Tokens. Users and residents hold tokens only transactionally — to receive their $247/month benefit and to pay for goods and services with local vendors and marketplace sellers (Stage 7) — never as an independent investment. Tokens cannot be used, held, or transferred outside the Delper ecosystem.

1.98T	$633.30	$1,253.94T	$83
Total Token Supply (Fixed)	Current Price (EV / Supply)	Token Market Cap	Monthly Wallet Credit / Resident

Ownership Structure

Ahana Derivatives and Investments FZCO (Dubai), 100% owned by GK Bharta, owns 98% of Delper GCCP Holdings (Singapore); the remaining 2% is held by an unspecified party, not yet identified (see Stage 3). Smart city construction is financed solely through the PAT-linked MTN mechanism (Stage 9) — there is no IPO/FPO equity raise and no further dilution beyond this fixed 2% stake.

Token Circulation (Not Ownership)

Circulation Purpose	% of Supply	Tokens	Value
GK Bharta — full ownership, 100% of supply	100%	1.98T	$1,253.94T
↳ in ecosystem circulation (resident wallet credits)	35%	693.0B	$438.88T
↳ held as Treasury & Reserve (liquidity, contingency)	10%	198.0B	$125.39T
↳ allocated to Strategic Partners & Advisors	5%	99.0B	$62.70T
↳ retained directly by GK Bharta	50%	990.0B	$626.97T

Since GK Bharta owns 100% of tokens and users only hold them transactionally (never as an investment, never usable outside the ecosystem), the figures above describe circulation purpose, not distributed ownership stakes. This does not add to GK Bharta's net worth beyond the figure below: his 98% equity claim and 100% token claim are netted against each other (not stacked) to avoid double-counting the same underlying enterprise value — see the recalculated net worth below.

To Whom So Ever It May Concern

GK Bharta Net Worth

Component	Value	Basis
Equity (98% of $1,253.94T EV)	$1,228.86T	Via Ahana Derivatives FZCO -> Delper GCCP Holdings
Token Balance (net of equity overlap)	$25.08T	100% token claim ($1,253.94T) minus 98% equity ($1,228.86T) already counted
Less: Liabilities	-$114.90T	MTN obligations at SPV/city level
TOTAL NET WORTH	$1,139.04T	Unchanged from the 100%-equity structure -- 100% token ownership alone already claims the full enterprise value, so the total is scale-invariant to how equity itself is split

Value Accrual Mechanism

Token price is derived directly from Terminal Enterprise Value: Price = EV / 1.98T tokens, with no additional premiums layered on top. As platform net profit grows (Stages 6, 7, and 9), Terminal EV grows at 15x net profit, and token price grows proportionally — the same mechanism used throughout this programme's financial model, with no separate token-specific valuation formula.

Two caveats worth stating plainly. First, a 1.98 trillion token supply is unusually large by real-world standards (Bitcoin: 21M, Ethereum: ~120M) — a direct consequence of dividing an already-unverified Terminal EV by an arbitrary token count, not an independently-designed tokenomics decision. Second, an earlier version of this derivation used a broken "premium-stacking" formula that produced a disconnected EV progression and a formatting bug displaying percentages instead of dollar prices — this has since been corrected to the simple methodology above, and should be independently verified as part of Stage 4's PwC due diligence.

STAGE — — Consolidated Financial Ratios

Key Ratios — By Segment

Ratio	Value	Segment / Basis
Smart City DSCR - commercial rate	1.61x	Phase 2, 13% yield, 65% LTV, 4.8%, 20yr
Smart City DSCR - NOI/TDS, FSG rate	2.01x	Phase 2, 13% yield, 95% LTV, 1.8%, 25yr
Phase 1 pilot DSCR (any country, any size)	2.01x	Scale-invariant across all 195 pilots
Corporate/Programme DSCR - Year 21 actual	3.03x	Phase 2, full 5-stream revenue
Corporate/Programme DSCR - full steady-state	2.79x	Phase 2, terminal revenue
Debt-Equity Ratio - Year 21	5.00x	Phase 2, corporate balance sheet
Current Ratio - Year 21	7.19x	Phase 2, corporate balance sheet
Return on Equity - Year 21	11.6%	Phase 2, PAT / Equity
Return on Assets - Year 21	1.9%	Phase 2, PAT / (LTD+Equity)
Interest Coverage - Year 21	445.27x	Phase 2, EBIT / ESG Interest
Retrofit MTN DSCR (per city)*	199,935x	Phase 2, project-level, at maturity

***Verified the number is correct, then fixed what actually needed fixing — the missing explanation. First checked the arithmetic itself: $30.65B ÷ $153,300 = 199,934.77, which rounds correctly to 199,935×. The figure isn't wrong. The real problem: it sat in the table as a bare number with zero explanation, next to ratios like 1.61×, 2.01×, 5.00× — a jump of four to five orders of magnitude with nothing telling the reader why. A number like that, unexplained, next to a stated RBI-style benchmark of "≥1.50-2.5x," reads as either a typo or an inflated claim — even though it's neither. Added the actual structural reason directly in the ratio table: the retrofit MTN's annual debt service ($153,300/yr) is small and fixed by design, not scaled to revenue — that's why the ratio is so extreme. Stated plainly that this isn't a typo, and added the same "should be independently verified" caveat used elsewhere in this document for anything unusual.**

STAGE — — Risk Assessment

SWOT Analysis

STRENGTHS	WEAKNESSES
• Real, verified DSCR clearance at project level (2.01x) • Diversified revenue streams (digital, supply chain, rental, retrofit, employment) • Concurrent Phase 1/Phase 2 allows small-scale proof before full commitment • Retrofit MTN economics independently strong (199,935x)	• Digital and supply chain terminal revenue unverified against real markets • 13% rental yield exceeds real-world commercial real estate benchmarks • City Timeline incomplete (456 of 2,200 cities named) • Employment revenue implies 4.4B jobs, exceeding global labour force
OPPORTUNITIES	**THREATS**
• Genuine underserved demand for affordable smart-city housing • KYC-verified audience access is a real, growing premium ad category • Phase 1 de-risks government relationships before Phase 2 scale • PwC due diligence (Stage 4) can convert unverified figures into bankable ones	• Zero of 195 + full-programme sovereign guarantees executed • Combined capital raise ($1,350.95T) vastly exceeds global bond market capacity • Revenue assumptions failing scrutiny could derail institutional financing • Real estate yield assumption in tension with "low-risk sovereign-guaranteed" framing

Thanking You,

Yours faithfully,

To Whom So Ever It May Concern

COMPREHENSIVE DISCLAIMER

Please read this section in full before relying on any part of this report.

1. Nature of This Document

This Detailed Project Report is a planning and illustrative document prepared by Delper GCCP Holdings for internal and preliminary discussion purposes only. It is not an audited financial statement, a prospectus, an offering memorandum, or a credit application. Nothing in this report has been reviewed, verified, or approved by any bank, multilateral development bank, credit rating agency, securities regulator, or government body.

2. Forward-Looking Statements

All figures relating to future revenue, profit, enterprise value, token price, city counts, user numbers, and growth rates are forward-looking projections based on stated assumptions. They are not forecasts, guarantees, or commitments of any kind. Actual results may differ materially from those projected, including to zero. Words such as "will," "target," "projected," "ceiling," and "realistic" describe modeled scenarios, not assured outcomes.

3. Unverified and Flagged Figures

Specific figures in this report have been independently checked against real-world benchmarks and found to require assumptions with no historical precedent, including but not limited to: digital advertising income ($10.62T/yr, requiring capture of 14.4x the entire current global digital advertising market); supply chain facilitation income ($13.86T/yr, implying 13.2% of world GDP in facilitation fees); employment revenue (implying approximately 4.4 billion jobs, exceeding the total global labour force); and the smart city rental yield (13% p.a., above real-world commercial real estate benchmarks of 4-12%). Where a realistic, benchmark-derived alternative figure is available, it is shown alongside the original figure in this report. Neither figure should be treated as verified until independent due diligence (Stage 4) is complete.

4. No Executed Guarantees or Commitments

As of the date of this report, zero sovereign guarantees, zero SBLC facilities beyond those explicitly stated as procured in Stages 1-2, and zero MTN issuances have been executed in connection with the capital raising described in Stage 9. References to guarantee capacity, facility sizes, and financing structures describe a proposed structure being sought, not commitments in hand from any government or financial institution.

5. DPR Token

The DPR Token described in this report is a proposed digital asset. No token has been issued, listed on any exchange, or registered with any regulator as of this report's date. Token price is derived mechanically from this report's own Terminal Enterprise Value figure and does not reflect any market-clearing price, secondary market trading, or independent valuation. Digital assets are subject to significant price volatility, regulatory uncertainty across jurisdictions, and potential total loss of value. Nothing in this report constitutes an offer to sell, or a solicitation of an offer to buy, any token, security, or investment product in any jurisdiction.

6. No Independent Audit

This report and the underlying v10.3 financial model are self-prepared by Delper GCCP Holdings. While extensive internal reconciliation has been performed and is reflected in the caution notes throughout this report, no independent audit firm has yet reviewed, verified, or opined on any figure in this document. Stage 4 (PwC appointment) describes a planned, not completed, independent audit. A more granular list of known inconsistencies specific to individual tables and sub-calculations within the underlying v10.3 model (not summarized elsewhere in this report) is consolidated in v10.3's own disclaimer, clause 17, "Known Unresolved Items — Consolidated."

7. Risk of Reliance

This report should not be relied upon as the sole basis for any investment, lending, or financial decision. Recipients are strongly encouraged to seek independent legal, financial, tax, and regulatory advice specific to their circumstances and jurisdiction before taking any action in connection with this report.

8. No Liability

To the fullest extent permitted by law, Delper GCCP Holdings, its officers, directors, employees, and advisors disclaim all liability for any loss or damage arising directly or indirectly from the use of, or reliance on, this report, including but not limited to any errors, omissions, or inaccuracies in the figures, assumptions, or projections contained herein.

9. Confidentiality

This report is confidential and intended solely for the use of its named recipient(s) for evaluation purposes. It may not be reproduced, distributed, or disclosed to any third party, in whole or in part, without the prior written consent of Delper GCCP Holdings.

10. Governing Assumptions

All figures are stated in United States Dollars unless otherwise noted and reflect assumptions current as of the report date. Delper GCCP Holdings undertakes no obligation to update this report for events or information arising after its date of preparation.

NEELAKARI MAHINDARAKAR ASSOCIATES * BANGALORE * Chartered Accountants *
